Man make machine, machine make music!

In recent years Artificial Intelligence has brought a wave of innovation to every possible field of human activity. Perhaps one of the most striking areas that things like machine learning and robotics are trying to delve into is the arts. An area, most commonly associated with human imagination, is more and more populated by the imagination of the artificial kind.

While it's true that all the arts are equally as important for the human spirit, none of them seems more fascinating from this aspect than music. Ergo, this presentation tries to provide some notes and thoughts on the subject of artificially created music and hopes to answer the question – Are machines becoming better musicians than man?
